New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

Disclosure; Page 17; 37pp; English.

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human discary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipsee (HPL) or human gastric lipsee (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #12 from llama (camelid) species

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #30 from llama (camelid) species
                                                                              Llama antibody; camelid; anorectic; heavy chain variable domain; VHH; human dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; food; human gastric lipase; HGL; cosmetic control; body weight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
Llama antibody; camelid, anorectic; heavy chain variable domain; VHH; human dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; food; human gastric lipase; HGL; cosmetic control; body weight; complementarity determining region 3; CDR3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antibody; camelid; anorectic; heavy chain variable domain; VHH; dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; human gastric lipase; HGL; cosmetic control; body weight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

                                                                                                                                                                                                                                                                                                                                                                                                            The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human panoreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #14 from llama (camelid) species
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Llama antibody; camelid; anorectic; heavy chain variable domain; VHH; human dietary enzyme inhibitor; medicament; human pancreatic lipase; HFL; food; human gastric lipase; HGL; cosmetic control; body weight; complementarity determining region 3; CDR3.
                                                                                                                                                                                                                                                                                                            New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
                                                                                                                                        New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Antisense, prokaryotic essential gene, cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Zyskind JW;

The invention relates to an isolated mucleic acid comprising any one of the G213 antisense sequences given in the specification where expression of the mucleic acid inhibite proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the mucleic acid of a permoter operably linked to the mucleic acid. (2) a host cell containing the vector; (3) an isolated collypeptide whose expression is inhibited by the antisense mucleic acid. (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense mucleic acid. (4) an antibody capable of specifically binding the polypeptide or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, or that inhibits cellular proliferation; (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway or required for proliferation. Or that inhibits cellular proliferation of an operance of the test compound that inhibits proliferation of an organism acid acreaming an antibiciotic; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent or organism acids of a compound that inhibits proliferation of an organism. The article of a compound that inhibits the proliferation of an organism. The article of a compound that inhibits the confidence or proliferation in cells other than S. aureus, S. typhimurlum, K. pneumoniae or p. aeruginosa. The present sequence is encoded by one of the tranget prokaryotic essential genes. Note: The sequence data for this process. The present did not form which acid proliferation in cells other than S. aureus, S. typhimurlan, and the control decomes and acid are useful for patient did not form with an article and proliferation in cells other than S. aureus, S. typhimurlan, and the control decomes and acid acid acid acid ac
                                                                   New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense; prokaryotic essential gene; cell proliferation; drug design.

The invention relates to an isolated nucleic acid comprising any one of the fill antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid cocding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding to polypeptide; (5) producing the polypeptide; (6) inhibiting cellular cranisense nucleic acid; (4) an antibody capable of specifically binding to proliferation or the activity of agene In an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway compound to a proliferation or that inhibits proliferation of an activity against a collection of an enably which he test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a scrivity; (11) a culture comprising strains in which the set compound that inhibits proliferation of the strains is present in a culture or collection of corpanism acts; (9) manufacturing an antibiotic; (10) profiling a compound; activity; (11) a culture comprising strains in which the strains is present in a culture or collection of the proliferation of an organism. The antisense nucleic acids required for proliferation in cells can be defined or for proliferation in cells can be defined or for screening for homologous nucleic acids required for proliferation in cells contained by neoliferation or form pare of the present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patined for patent format directly from wire the present sequence in electronic format directly from the present sequence is encoded by one of the pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense; prokaryotic essential gene; cell proliferation; drug design.

Haselbeck R, Yamamoto R,

the 6113 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway cequired for proliferation or the the inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation or the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound's activity; (11) a culture comprising strains in which the gene product is oversxpressed; (12) determining the extent to be which the server compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene or which the server compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which activity; (12) determining the extent the compound that inhibits or a strent or the server or an extent or an extent or a server or a determined to a compound or a server or a determined to a compound or an extent or a server or a determined to a compound or an extent or a server or a determined to a compound or a compound or a compound or an extent or a server or a determined to a compound or a compound or an extent or a server or a determined to a compound or a compound or an extent or a server or a ser drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at the wipo.int/pub/published\_pot\_sequences to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for ceilular proliferation to isolate candidate molecules for rational

This invention describes novel isolated nucleic acid molecules (I)
encoding a human secreted proteins (II) which have immunosuppressive,
antistribritic, antirhenuatic, antiproliferative, cytostatic, cardinate,
vasotropic, cerebroprotective, nootropic, neuroprotective, antibacterial,
virucide, fungicide, ophthalmological and vulnerary activity and can be
used for gene therapy. (I) and (II) are used to prevent, treat or
c used for gene therapy. (I) and (II) are used to prevent,
c used aptabological condition in e.g. humans, mice, rabbits, goats,
horses, cats, dogs, chickens or sheep. (I) and (II) are also used in
diagnosing a pathological condition or susceptibility to a pathological
condition. The artibodies to (II) can also be used in alleviating
symptoms associated with the disorders and in diagnostic immunoassays
e.g. radioimmunoassays or enzyme linked immunosorben assays (ELSA).
Disorders which are diagnosed or treated include autoimmune disease e.g.
rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the
breast or liver, cardiovascular disorders e.g. cardio arteated
corpusation disorders e.g. Alzheimer's disease, infections caused by bacteria,
viruses and fungi and coular disorders e.g. corneal infection. The
polypeptides can also be used to aid wound healing and epithelial cell
proliferation, to prevent skin aging due to subburn to maintain organs
to regenerate tissues and in chemotaxis. The polypeptides can also be
to regenerate tissues and in chemotaxis. The polypeptides can also be
to regenerate tissues and in chemotaxis. The polypeptides can also be
                                                                                                                                                                                antiproliferative, cytostatic, cardiant, vasotropic, cerebroprotective, noctropic, neuroprotective, antibacterial; virucide, fungicide, ophthalmological; vulnerary, gene therapy, treatment, autoimmune disease, hyperproliferative disorder; cardiovascular disorder; cerebrovascular disorder, nervous system disorder; infection, skin aging; wound healing; epithelial cell proliferation; transplantation.
                                                                                                                                                                Secreted protein; human; immunosuppressive; antiarthritic; antirheumatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            preventing, treating or ameliorating a disorder, e.g. Alzheimer's and Parkinson's diseases and cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, and earlyative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the movel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the composition, a method for identifying a pharmaceutical composition, a cutivity in an animal of one or more of the regulates the security in an animal of one or more of the regulates the cutivity is useful for preparing a medicament for treating condulates its activity is useful for preparing a medicament for treating polypeptides or their antibodies. The polymucleotide or the compound that modulates its activity is useful for preparing a medicament for treating consideration, which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed consideration, but was obtained in electronic form directly from WIPO at Etp. who. int/pub/published_pot_equences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                    Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Costigan M;

AAY73325-Y73389 are human transcriptional regulator molecule (HTRM)

protein sequences. The HTRM protein and nucleotide sequences are useful

for preventing or treating disorders associated with decreased expression

or activity of HTRM which include cell proliferative disorders such as

leukaemia; immune disorders such as AIDS, Addison's disease, diabetes

melitus, rheumatoid arthritis, multiple sclerosis, systemic lupus

crythematosus, and myasthenia gravis; infections and trauma. Antagonists

of the HTRM polypeptides are useful for treating or preventing disorders

sosciated with increased expression or activity of HTRMs. HTRM

polypeptides, their immunogenic fragments or oligopeptides are useful for

screening libraries of compounds in drug screening techniques.

Company of Company of HTRM are useful for blocking the transcription

of mRNA and regulating gene function by modulating the activity of HTRM.

Vectors expressing HTRM or agonists can also be used to prevent or treat

disorder associated with decreased HTRM expression. Antibodies which

specifically bind HTRM and polymucleotides encoding HTRM are useful for

disorder associated with decreased HTRM. Nucleotide sequences

of massays that detect the expression of HTRM. Nucleotide sequence

croding HTRM may be useful to generate hybridization probes useful in

mapping the naturally occurring genomic sequence and to detect

differences in gene sequences among normal, carrier and affected

individuals. Using diagnostic assays, cancer can be detected prior to the

appearance of clinical symptoms and therby progression of cancer can be

companied. The sequence are supplemented by progression of cancer can be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New peptides useful for diagnosis, prevention and treatment of cancer and immune disorders.

Biochem. J. 292:137-142(1993).
--- FUNCTION: Endopeptidase that degrades small peptides of less than 7 kDa, such as glucagon and insulin.
--- CATALYTIC ACTIVITY: Preferential cleavage of 16-Tyr-|-Leu-17 and 25-Phe-|-Tyr-26 bonds of oxidized insulin B chain. Also acts on other substrates of Mw less than 7 kDa such as insulin and

Bacteriol, 185:2330-2337(2003).
-!- FUNCTION: Endopeptidase that degrades small peptides of less than 7 kDa, such as glucagon and insulin (By similarity).
-!- CATALYITA ACTIVITY: Preferential cleavage of 16-Tyr-|-Leu-17 and 25-Phe-|-Tyr-26 bonds of oxidized insulin B chain. Also acts on other substrates of Mw less than 7 kDa such as insulin and

-: TISSUB SPECIFICITY: Hemolymph.
-: DEVELOPMENTAL STAGE: Expressed 30 minutes after infection and remained present through to 21 days. Expressed in white or callow pupae during metamorphosis, but no expression was seen in larvae.
-: INDUCTION: By bacterial infection.

Genome Biol. 3:RESEARCH0083.1-RESEARCH0083.22(2002).
-!- FUNCTION: Involved in morphogenesis. May also be involved in cell
                                                                                                                                                                                                                                                                                adhesion.
-!- SUBCELLULAR LOCATION: Type I membrane protein (Potential).
-!- TISSUE SPECIFICITY: Expressed in embryonic ectoderm. In larvae, expression is restricted to imaginal disks and brain.
-!- DEVELOPMENTAL STAGE: Expressed throughout embryogenesis where it is first detected during gastrulation. Also expressed in larvae

Schnitz J., Faist G.;

"Comparative studies on the structural gene for the ribosomal protein S1 in ten bacterial species ";

MOI. Gen. Genet. 200:476-481(1985).

INITIATION POINT. IT IS NEEDED TO TRANSLATE MRNA WITH A SHORT SHINE-DAGARNO (SD) PURINE-RICH SEQUENCE (BY SIMILARITY).

-!- SIMILARITY: Belongs to the S1P family of ribosomal proteins.
-!- SIMILARITY: Contains 5 S1 motif domains.

"Complete genome sequence of Pseudomonas aeruginosa PAO1, an

opportunistic pathogen."

I PODF STRAINS CATALYSE The overall synthetic reaction is composed of two sequential steps, AdoMet formation and the subsequent

two sequential steps, AdoMet formation and the subsequent

two sequential steps, AdoMet formation in to release of

AdoMet Erom the enzyme (By similarity).

C GATALYTIC ACTIVITY: ATP + L-methionine + H(2)O = phosphate +

AdoMet Erom the enzyme (By similarity).

C GATALYTIC ACTIVITY: ATP + L-methionine as amagnesium or cobalt, and

I potassium ion per subunit (By similarity).

LI PATHWAY: Activated methyl cycle.

LI STBELDIAR LOCATION: Cytoplasmic.

STBELLIAR LOCATION: Cytoplasmic.

SIMILARITY: Belongs to the AdoMet synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               PROSITE; PS00376; ADOMET SYNTHETASE 1; 1.

New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.

Disclosure; Page 17; 37pp; English.

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HCL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #14 from llama (camelid) species
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Llama antibody; camelid; anorectic; heavy chain variable domain; VHH; human dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; food; human gastric lipase; HGL; cosmetic control; body weight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid of light chains.
                                                                                                         Gaps

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antibody; camelid; anorectic; heavy chain variable domain; VHH; dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; human gastric lipase; HGL; cosmetic control; body weight.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #30 from llama (camelid) species
                                                                                                              Llama antibody; camelid; anorectic; heavy chain variable domain; VHH; human dietary enzyme inhibitor; medicament; human pancreatic lipase; HPL; food; human gastric lipase; HGL; cosmetic control; body weight.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                                                         The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is HPL inhibiting VHH fragment, HPL #12 from lama (camelid) species

The patent discloses antibodies or their fragments comprising a heavy chain variable domain (VHH) derived from an immunoglobulin naturally devoid of light chains specific for inhibiting human dietary enzymes. The antibodies of the invention are useful for the preparation of medicaments or food for inhibiting the activity of one or more human dietary enzymes especially human pancreatic lipase (HPL) or human gastric lipase (HGL) which are useful for the cosmetic control of body weight of human beings. The present peptide sequence is a complementarity determining region 3 (CDR3) of llama species (camelid) antibody VHH region
                                                                                                                                                                                                                                                                                                                                           New antibody or its fragments for inhibiting human dietary enzymes, useful for cosmetic control of body weight of human beings, comprises heavy chain variable domain derived from immunoglobulin naturally devoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0; Gaps

The invention relates to a secretory polynucleotide (designated sptm)

Comprising any of 567 polynucleotide sequences (AB25837-AB258463), a

naturally occurring polynucleotide sequence at least 90 % identical to

the polynucleotide sequence, a polynucleotide complementary to them or an

End of the polynucleotide sequence at least 90 % identical to

RNA equivalent of them. The polypeptide or polynucleotide are useful for

End of the sexpression of functional SPPM. These are particularly useful for

the expression of functional SPPM. These are particularly useful for

the expression of functional SPPM. These are particularly useful for

the expression of functional SPPM. These are particularly useful for

the expression of functional SPPM. These are particularly useful for

diagnosing, treating or preventing autoimmune/inflammatory disorders

(e.g. acquired immunodeficiency syndrome, anaemia, asthma or Crohn's

disease), neurological disorders (e.g. epilepsy, Huntington's disease,

multiple sclerosis, cerebral palsy, Parkinson's disease, anxiety,

children or annesia), or cell proliferative disorders (e.g.

schizophrenia or annesia), or cell proliferative disorders (e.g.

leukaemia, lymphoma, melanoma, myeloma, sarcoma or cancers of the brain,

breast, cervix or prostate). The present sequence dison

for this patent did not form part of the printed specification, but was

cobtained in electronic format directly from WIPO at

cut the properties of the invention compart of the printed specification, but was

cobtained in alectronic gequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ó

This invention describes novel isolated nucleic acid molecules (I)
encoding a human secreted proteins (II) which have immunosuppressive,
antiatthritic, antirhemuatic, antiproliferative, cycostatic, cardiant,
vasotropic, cerebroprotective, nootropic, neuroprotective, antibacterial,
virucide, fungicide, ophthalmological and vulnerary activity and can be
used for gene therapy. (I) and (II) are used to prevent, treat or
used for gene therapy. (I) and (II) are used to prevent, treat or
used for gene therapy. (I) and (II) are used in be
used to prevent, treat or
diagnosing a pathological condition or susceptibility to a pathological
condition. The antibodies to (II) can also be used in
condition. The antibodies to (II) can also be used in alleviating
symptoms associated with the disorders and in diagnostic immunoassays
of symptoms associated with the disorders and in diagnostic immunoassays
is condition. The artibodies to (II) can also be used in alleviating
system disorders which are diagnosed or treated include autoimmune diseases e.g.
rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest,
crebrovascular disorders e.g. carebral ischemia, angiogenesis,
crebrovascular disorders e.g. carebral ischemia, angiogenesis,
crebrovascular disorders e.g. corebral infections caused by bacteria,
polypeptides can also be used to aid wound healing and epithelial cell
proliferation, to prevent skin aging due to sunburn, to maintain organs
of the polypeptides can also be used to aid wound represent the content or and to the content of primary tissues,
content or an also be used to aid wound represent the content organs
of the content or and the content skin aging due to sunburn, to maintain organs
of the content or an also be used to subpring cell culture of primary tissues,
content or an also be used to subpring cell culture of primary tissues,
content or an also be used to subpring cell culture of primary tissues,
content or an also be used to aid wound healing and epithelial contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             regenerate tissues and in chemotaxis. Claim 3; SEQ ID NO 1089; 2067pp; Japanese.

Enterohemorragic Escherichia coli 0157:H7-specific nucleic acid molecule and a polypeptide and its use, a polypeptide, a vector and a host cell.

The invention relates to a novel enterchaemorragic Escherichia coli 0157:H7-specific nucleic acid molecule. A polynucleotide of the invention has anti-bacterial activity. The polypeptide can be used in detection and/or treatment of 0157:H7 infection. The nucleotide sequence of the genome of Enterchaemorragic E coli 0157:H7 was determined. The present

The first of the composition comprising two or more isolated rate of this man polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit in craases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more modulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (chung), chronic constriction o O Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung. New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal. The invention discloses a composition comprising two or more isolated Gaps .. DB 7; Length 437; 58; 3; Indels 2; Mismatches Costigan M; Score 40; Pred. No. Rat Protein AAB86925, SEQ ID NO 571. injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a rat protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Leach MD, Shimkets RA;

MPI; 2002-106200/14. N-PSDB; ABN79519. Novel human polypeptides and polynucleotides useful for diagnosing, preventing and treating cardiovascular disease, neurodegenerative, hyperproliferative disorders and disorders related to organ transplantation

Claim 10; Page 2475; 2508pp; English.

Sequences ABP31028-ABP35561 represent 4534 novel human proteins designated ORF (Open reading frame) 1-4534, and sequences ABN7558-ABN75587 represent cDNAs encoding them. The invention also encompasses polypeptides at least 80% identical to the ORF1-ORF4534 (collectively referred to as ORFX) proteins, polynucleotides at least 85% identical to the ORF1-ORF4534 S\$\$ identical to the ORF1-ORF4534 S\$\$ identical to the ORFX nucleic acid sequences, vectors and host cells comprising ORFX polynucleotides, the recombinant production of ORFX proteins, antibodies

cc specific for OREX proteins, methods of detecting OREX polynucleotides and activity, and methods of screening individuals for a predisposition to an CCC activity, and methods of screening individuals for a predisposition to an CRPX-associated disorder. The OREX proteins of the invention have a wide range of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haemacopoiesis regulation, tissue growth, angiogenesis, activity hamonicity, chemotactic/ chemokinetic activity, haemostatic activity, thrombolytic activity, chemotactic/ chemokinetic activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. OREX proteins, and antiinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. OREX proteins, contact acids and antibodies may be used in the treatment of cancers, cother proliferative disorders such as psoriasis and benign tumours, cother proliferative disorders such as epoilepsy and Alzheimer's disease, cardiovascular diseases, immune system disorders, disorders related to organ transplantation, disorders of tissue growth and regeneration, diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester cardiovascular diseases, immune system disorders in the detection of ORFX genomic sequences cord primers and probes, in the detection of ORFX genomic sequences or transcripts, in the identification and cloning of homologous cordeness, in genetic diagnosis, and in forection and cloning of homologous curved may be useful for studying the function and cloning of ortivity of ORFX protein, and in drug screening. The ORFX proteins may be used as immunogens to generate specific antibodies, which are useful in the monitoring of ORFX-associated diseases immunogens to generate specific antibodies, which are useful in the configuration of ortives.

-!- FUNCTION: Endopeptidase that degrades small peptides of less than 7 kDa, such as glucagon and insulin.

-!- CATALYTICA CTIVITY: Preferential cleavage of 16-Tyr-|-Leu-17 and 25-Phe-|-Tyr-26 bonds of exidized insulin B chain. Also acts on other substrates of Mw less than 7 kDa such as insulin and
